

E-21 single use fluid Management system

Lower pressure detectable (from 20mmHg)

E-21 is the optimal pump for endoscopic spinal surgery cases. Unlike other pumps, E-21's water pressure can be adjusted from 20mmHg, which is crucial for reducing post-operative complications. E-21's saline inflow is precisely regulated, ensuring an adequate flow that conventional pumps cannot match.

E-21 is the simple and cost-effective option for other endoscopic surgery cases.

Battery operated (5 hours)

This is an ideal solution for hospitals and clinics with a high volume of endoscopic surgery cases. It provides a reliable backup to existing pumps in case of unexpected failure or busy schedules. This simple yet reliable wireless irrigation console is the ideal solution for efficiently setting up operating rooms and increasing turnover, allowing surgeons and staff to work more effectively.

Clear monitoring without bubbling

E-21 is also an excellent choice for hospitals and clinics with limited endoscopic surgery cases. E-21 is the ideal solution for hospitals and clinics that require irrigation pumps for a limited number of cases. Instead of investing in expensive pumps that are used only occasionally, they can simply purchase E-21, an affordable disposable pump, whenever they need it.

Pump-tube bundle system

E-21 is straightforward to set up and use. Surgeons and staff can simply plug it in and start using it without any preparation or training.
